

ABSTRACT OF THE DISCLOSURE

A quick-mount support includes a fixed retainer adapted to extend into a first retainer aperture and a movable retainer having an arcuate slot and adapted to extend into a second retainer aperture. The quick-mount support further includes a pivotable actuator, apparatus for mounting the pivotable actuator for pivoting movement about an actuator pivot axis, and a driver coupled to the pivotable actuator and arranged to move in the arcuate slot in the movable retainer. Movable retainer pivots about the retainer pivot axis toward and away from the fixed retainer in response to pivoting movement of the pivotable actuator about the actuator pivot axis. In one illustrative embodiment, the mounting apparatus comprises an elastic, deformable O-ring for pivotally mounting the pivotable actuator about an anchor mount so that the actuator pivot axis can shift as the driver moves in the arcuate slot.
